

LIFESAFE

A Single Mental Wellness App For People
Seeking Help

Made By Jayden Ankrah, Leonardo Odagui, and Dylan
Kukulka

What is **LIFESAFE**

LIFESAFE is a digital wellness companion for people who want quick, private support.

What We Solve

Lifesafe is an **on-demand wellness** companion for people who want quick, private support

It combines **mood journaling**, **saved reflections**, and a **friendly AI chat experience** so users can start feeling better without waiting through long clinic lines or confusing intake systems

Goals For LIFESAFE

Safety

Self worth

**Self
Improvement**

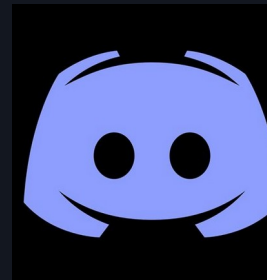

| What Was Used

This project uses a modern **web-stack with a React + Vite** frontend for a fast, **component-driven UI** and. The backend is implemented in **FastAPI (Python)** for the backend.

Development and ops tooling **included Git/GitHub** for source control **and CI/CD (GitHub Actions)**, **VS Code** for development.

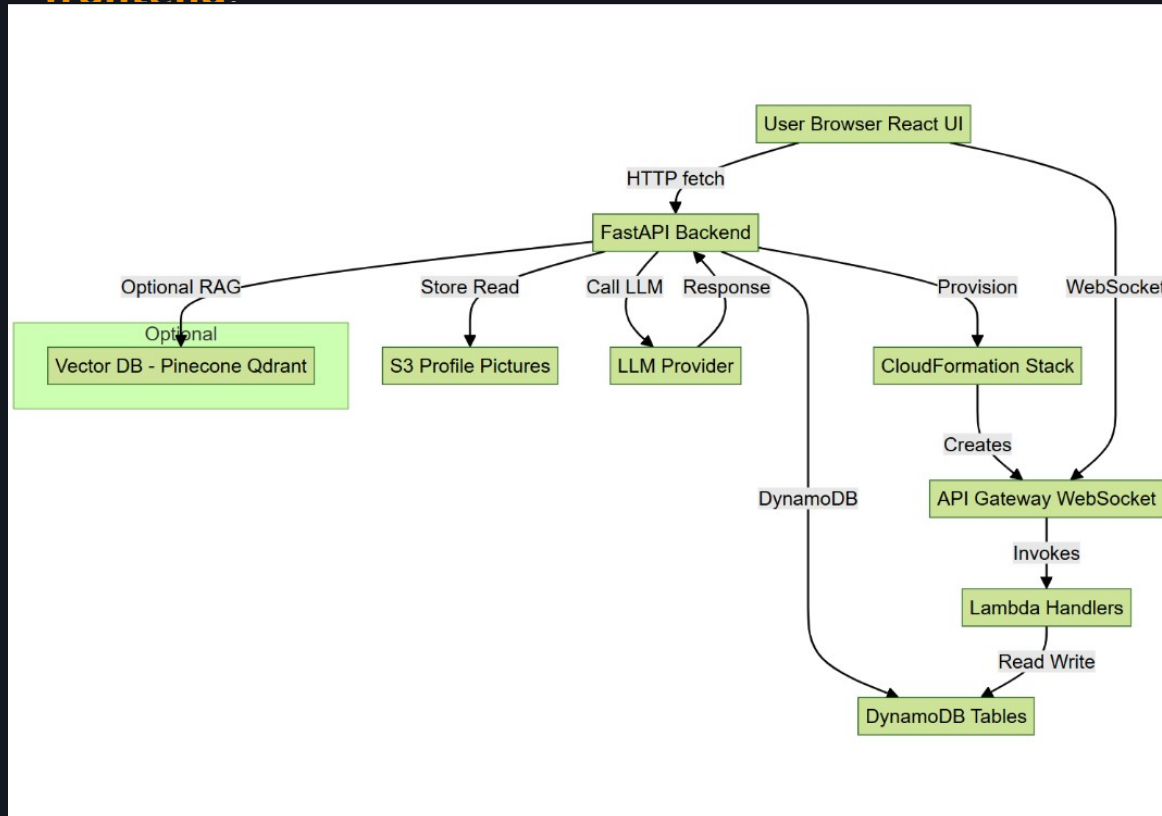

We used **Discord** and **Microsoft Teams** to connect with each other to plan and execute accordingly.

Architecture Diagram

This architecture represents a full-stack application centered around a **FastAPI backend** and a **React frontend**.

Things To Note

- Frontend to Backend Communication
- Core Backend Responsibilities (FastAPI)
- Infrastructure & Provisioning

Problems Faced And Solutions Found

Problems

AI problems

We didn't know how to build the AI assistant or what to use for it

People Difficulties

Originally, we were supposed to have six people but had three

Learning Curve

For some of the tasks that we wished to do we did not know how to

Solutions

Proper Handling

In the end we used GPT 5.5 Nano and used it as our ai therapist using a API key

Task Management

We learned how to properly distribute the weight equally for the tasks received

Off Task Learning

We learned off of YouTube tutorials to fill in our gaps of knowledge.

LIFESAFE ROADMAP

Early June

- Build initial app structure using **React + Vite**.
- Set up standard UI layout and navigation templates.

Early July - Late July

- Build real-time chat components (Chat Window, Friends List, Message Input).
- Powered chat via **WebSockets, AWS Lambda, and DynamoDB**.

Late June -Early July

- implement routing architecture with protected routes.
- Deploy secure microservices for **OTP (One-Time Password) login**.

Late July - Early August

- Connect streaming **AI backend to frontend** streaming APIs.
- Deliver real-time, responsive conversational support.

May

We kicked off in May with **Prototyping in Figma** to map out the core mental health experience and how it should look.

| How AI shaped our prod

Rapid Prototypes

With AI we were given the ability to quickly **create sketches** to get an idea of what our product should look like.

User Support

Using AI we made an built in **therapy companion** to help give users a place to vent without any barriers

Support

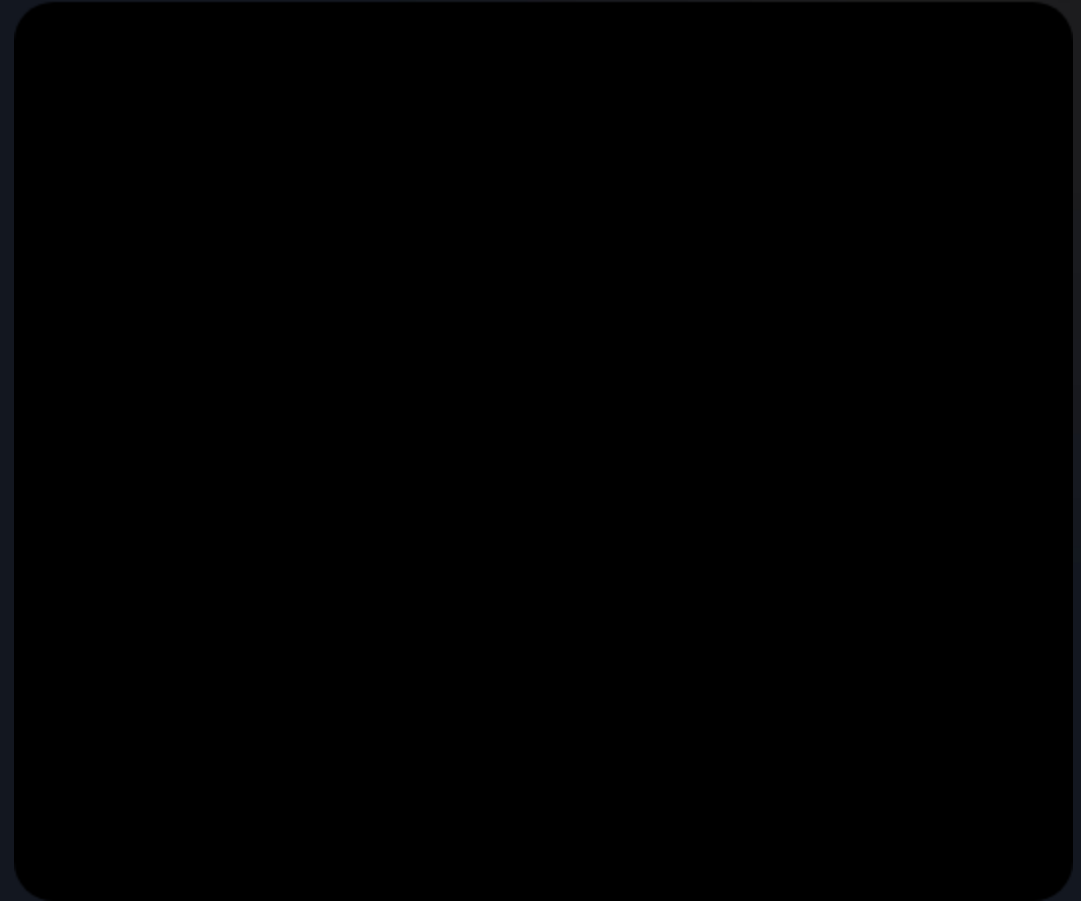

AI gives us the ability **to learn instantly** from our mistakes at hand instead of questioning what was wrong and where

AI Therapist

The **"Get Help Now"** portal acts as a critical lifeline.

When people are not able to get the proper help that they need we have our own AI Therapist on hand to assess the situation and give guidance when needed
